

Security Manager for SharePoint

MetaVis SECURITY MANAGER for SharePoint and Office 365 allow users to analyze and manage permissions, groups/users and levels across multiple site collections and farms. It is designed to both simplify cumbersome tasks and provide in-depth analysis of existing security rights from the convenience of your desktop and without installing anything on your SharePoint servers. **MetaVis SECURITY MANAGER** ensures that SharePoint security policies are assigned properly and offers reporting capabilities to help identify potential security risks.

Built on **MetaVis** Information Architecture Platform, **SECURITY MANAGER** operates seamlessly with the **MetaVis** family of products for SharePoint migration, design, change management and classification. **SECURITY MANAGER** supports SharePoint 2010, 2007, BPOS and Office 365.

MetaVis SECURITY MANAGER deploys in just a few minutes and takes full advantage of standard SharePoint APIs eliminating the need for custom server side controls, SQL Server access or elevated privileges. Security trimming is built in so that users are only able to view and manage objects that they have rights to in SharePoint. In addition, since the solution is totally agentless you can manage a hosted SharePoint environment such as Office 365 in the same way as on-premises systems.

With **MetaVis SECURITY MANAGER**, SharePoint administrators will be able to see and manage what a user has access to and who can access specific sites; identify orphaned users; and compare or synchronize permissions across SharePoint 2010, 2007 or Office 365, including hybrid environments.

- **Browse, add, edit and delete groups, users, permissions and permission levels in a visual hierarchical structure of site collections, sites, lists and individual items**
- **One easy to use interface for managing multiple server farms, domains and site collections**
- **Copy groups, users, permissions and permission levels between server farms, site collections, sites, lists and individual items across user directories (LDAP, ADFS, RDBMS)**
- **Manage permissions for multiple objects at the same time**
- **Analyze a user's or group's permissions for any site, list or item**
- **Analyze which users or groups have permissions for a specific object**
- **Identify orphaned users within SharePoint**
- **Compare an object's permissions to better manage permission templates and identify where permissions do not match the templates**
