

Information Manager for SharePoint 2010

MetaVis INFORMATION MANAGER for SharePoint provides SharePoint users the power to bulk tag, import and re-classify documents directly in SharePoint 2010. **INFORMATION MANAGER** appears seamlessly in the SharePoint ribbon. Authorized SharePoint users can copy content between different SharePoint sites, site collections, list and libraries and bulk import from File Shares and tag in one quick, simple process from the SharePoint ribbon. SharePoint users have more control to add in appropriate metadata to documents making documents more useful and easily found!

SharePoint 2010 provides tagging and classification technology but is limited to individual items. This makes classifying or importing multiple documents time consuming and tedious.

MetaVis INFORMATION MANAGER allows users to select multiple documents from SharePoint sites, libraries, lists, file shares or search results and import / classify in bulk. A simple wizard guides the user through a variety of tagging options. Users can create templates to help classify content for specific projects or activities further simplifying the process. By making classification and importing content easy for the user, content becomes more findable and accessible.

- *Empower SharePoint users to tag documents in bulk*
- *Change content types for multiple selected documents and specify field values*
- *Reorganize your content as you improve your Information Architecture*
- *Remap your content into new fields and content types*
- *Improve document find-ability, search, accessibility and navigation through SharePoint libraries*
- *Bulk import and classify content from File Systems*
